This document contains the contents of the project work for computer programming course, pertaining 40 points from the finals.

## Final Exam Project:

Name: Mohammad Rauf Student Number: B2105.010002

Department: Computer Engineering

Subject Code: COM117

Subject Name: COMPUTER PROGRAMMING-I

The proceeding explanations will be a detailed analysis of the project work. The build of the project is a makeshift calculator that does basic functions but also covers some extensive topics as well. Albeit not the best one that could have been made but also fitting the requirement as much as possible, covering all the topics taken up until these points:

The code is comprised in the following format:

- 1. Libraries inclusion.
- 2. Naming functions.
- 3. Main function where all the respective functions are called.
- 4. Ending main.
- 5. Started identifying and creating the named functions.

This program was created for the sole purpose of making an all-in-one convenient working calculator, and for the purpose of learning and understanding the nature of coding. It is also in terms of its functionality very convenient and practical and includes with it, history functionality, where all the outputs are collected and saved and can be called upon later.

This project also covers all parts pertaining to the course taken, meaning all topics covered in the class and homework, or otherwise, were covered.

## Code Overview:

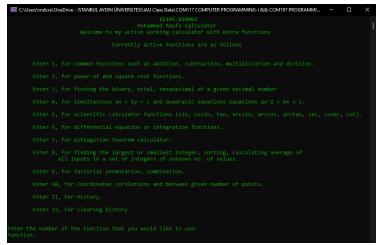

The code starts with the usual library calling, mainly <stdio.h> for our C functions, and <math.h> for all our mathematical functions.

Then it proceeds to name the functions, this approach was taken because it was intended that the main() function be up top and the other functions that are to be called are at the bottom, mainly for the sake of appearances.

This code also covers major topics taken in this course, mainly including the likes of structs, files, arrays, and memory allocation. This code consists of an extensive implementation of all terms and concepts clarified by the instructor, with the added benefit of being extremely user friendly and from the moment of running will also be very self-explanatory. For an in-depth manual, refer bellow.

## User manual:

The program when run the first time will display something like this:

Displaying all the possible capabilities of the program. Any input by the user will be taken and an action will be performed.

Note: Do not enter a character. This will break the code and isn't really the function of this calculator.

If any number that is above 12 and bellow 1 is entered, the program detects an error and re prompts the user to enter their desired function again, there are only 3 attempts so after the third wrong entry the program ends.

If 1 is entered, the user is prompted to enter an operator then they are requested to enter two values and the program prints the output.

```
input an operator '+' , '-' , '/' , '*' : /
enter 2 values:
value 1: 2500
value 2: 1500
The result of 2500.00 / 1500.00 = 1.667
continue? (y/n) : _
```

If 2 is entered, the function allows calculation of any number with any exponent and can also calculate root of any number.

```
Enter:
1. for Power function.
2. for Square Root function.
Function: 1
enter a number: 1256
enter a power: 3
The 3 power of 1256.00 is equal to 1981385216.00
continue? (y/n):
```

```
Enter:
1. for Power function.
2. for Square Root function.
function: 1
enter a number: 1256
enter a power: 3
The 3 power of 1256.00 is equal to 1981385216.00
continue? (y/n) :
```

If 3 is entered, the program can calculate the binary, hexadecimal and octal of a given integer.

```
Enter a decimal number: 256636 hexadecimal = 3EA7C octal = 765174 binary = 1111101010011111100 continue? (y/n) :
```

If 4 is entered, the program can find the values of X and Y, from simultaneous equations given that the values are a, b, c, I, j and k, from ax + by = c and ix + jy = k, and a, b and c from  $ax^2 + bx + c$ .

```
Enter 1 for simultanious equations.

Finet 1 for quadratic equations.

Finet 2 for quadratic equations.

Finet 2 for quadratic equations.

Finet 3 for simultanious equations.

Finet 4 for simultanious equations.

Finet 5 for quadratic equations.

Finet 6 for simultanious equations.

Finet 6 for simultanious equations.

Finet 7 for simultanious equations.

Finet 8 for quadratic equations.

Finet 9 for quadratic equations.

Finet 1 for simultanious equations.

Finet 8 for quadratic equations.

Finet 9 for quadratic equations.

Finet 1 for simultanious equations.

Finet 1 for simultanious equations.

Finet 9 for quadratic equations.

Finet 9 for quadratic equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious is unique

The value of x can be varied and y can be calculated according to x's value using relation

Finet 1 for simultanious equations is unique

The value of x=0.923

The value of y=1.969

Continue? (y/n):

Finet 1 for simultanious equations.

Finet 2 for quadratic equations.

Finet 3 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 1 for simultanious equation of the form Ax+By=C

Finet 2 for quadratic equations.

Finet 3 for x
```

If 5 is entered, the number "a" taken from the user will be used in almost all the trigonometry functions.

## Example:

Sin(a) cos(a) tan(a) arcsin(a) arccos(a) arctan(a) csc(a) sec(a) cot(a)

```
rees or Radians:
                          Enter 1 for degrees. Enter 1 for degrees.
inter 1 for degrees.
                          Enter 2 for radians. Enter 2 for radians.
enter 2 for radians.
lumber:1
                          Number:1
                                                   Number:1
inter your number: 60
                          Enter your number: 90 Enter your number: 180
                          sin = 1.000
                                                   sin = 0.000
\sin = 0.866
cosin = 0.500
                          cosin = 0.000
                                                   cosin = -1.000
                          tan = 557135115.021
                                                   tan = -0.000

                          sec = 557135115.021
                                                   cosec = 278567557.510
cot = -278567557.510
                          cosec = 1.000
cot = 0.577
                          cot = 0.000
```

If 6 is entered, it calculates the output of a polynomial function and the output of its derivative as well.

```
Enter the degree of polynomial equation:

2

Enter the value of x for which the equation is to be evaluated: 3

Enter the coefficient of x to the power 0: 0

Enter the coefficient of x to the power 1: 1

Enter the coefficient of x to the power 2: 2

The value of polynomial equation for the value of x = 3.00 is: 21.00

The value of the derivative of the polynomial equation at x = 3.00 is: 13.00

continue? (y/n): y_
```

If 7 is entered, we have a Pythagorean theorem calculator, where we first enter the missing value, and then we enter the values of the other missing variables. Hypotenuse (squared) = base (squared) + height (squared)

```
which missing value is needed to be calculated.

Enter 1. Hypotinuse
Enter 2. Base
Enter 3. Hight

Selection:1
Enter your Values:

base = 12
hight = 16
hypotinuse = 20.000

continue? (y/n): ______

which missing value is needed to be calculated.
Enter 1. Hypotinuse
Enter 2. Base
Enter 3. Hight

Selection:3
Enter your Values:

base = 12
hypotinuse = 20
hypotinuse = 20
continue? (y/n): ______
```

If 8 is entered, we can find the largest or smallest integer, sorting, calculating average of all inputs in a set of integers of unknown number of values.

This is where the concept of memory allocation was used, pointers was used for this.

```
Enter the number of values: 5
entry 1 : 1
entry 2 : 2
entry 3 : 5
entry 4 : 6
entry 5 : 8
Ascending order = 1.00 2.00 5.00 6.00 8.00
Descending order = 8.00 6.00 5.00 2.00 1.00

Largest Value is 8.00
Smallest Value is 1.00
The average of provided numbers = 4.400

Continue? (y/n):

Enter the number of values: 10
entry 1 : 125
entry 3 : 854
entry 4 : 256
entry 3 : 854
entry 5 : 2584
entry 5 : 2584
entry 5 : 2584
entry 6 : 5623
entry 7 : 32587
entry 8 : 254414
entry 6 : 635.00 854.00 2584.00 5623.00 32587.00 254141.00

Descending order = 0.00 125.00 212.00 256.00 635.00 854.00 2584.00 635.00 256.00 212.00 125.00 0.00

Smallest Value is 1.00
The sum of the values = 22.000
The sum of the values = 22.000
The sum of the values = 29729.000

Continue? (y/n):
```

If 9 is entered, the program calculates factorial, permutation, and combination of given parameters.

```
Enter A for Factorial.

Enter B for permutation.
Enter C for combination.
TYPE IN X FOR ALL: x
Enter n:15
Enter r:10

10! = 3628800
15P10 = 16702583
15C10 = 4

continue? (y/n): _______

Enter A for Factorial.
Enter A for Factorial.

input X8 coordinates: 159
input X8 coordinates: 159
input X9 coordinates: 159
input X8 coordinates: 159
input X9 coordi
```

The numbers 11 and 12 are history managers, where 11 displays the history of the system calculator and 12 erases the calculator history.

This part of the code deals entirely with files, continuously printing all outputs into a folder and can be called into the function any time.

The openness of the calculator allows for more versatility in the future allowing for more functions to be added.

The code :::::::

```
